

Brake Force intensifier for Heavy Trailers

The miniBOOSTER G-model can solve brake force problems on-off highway trailers, for example heavy equipment for use in mines etc.

Driving downhill with heavy loaded trailers can cause trouble, due to the lack of brake force.

By using a miniBOOSTER hydraulic intensifier the brake force can be increased.

The G-model allows the brake force to follow the truck brake force proportionally up and down in pressure. As the system provides full brake force with no pressure, the safety issue is well controlled.

Quick connectors are a potential dirt source. A filter is added to avoid dirt from entering into the hydraulic brake system.
