

Removal of Solid Tires in Mobile Applications

The challenge of onsite servicing forklift, bobcats etc. with solid rubber tires has successfully been solved by an Australian company.

Pressing the solid tires "on and off" requires heavy force. In many cases the tires had to be transported back to the workshop and removed by a large press. The challenge can be met by using an HC4-2.0-B-1 miniBOOSTER tapping directly into the hydraulic system of the van.

Mobile press

A fixed rubber tire

HC4 intensifier placed under the truck body
